

COASTER GRID: Simple Game Overview

What it is, how you play, and why it is fun | RollerCoaster Tycoon meets Mini Metro

The Core Idea in One Sentence

You build miniature roller coasters in an isometric 2.5D theme park to move crowds of visitors between park zones, racing against time to prevent queue lines from overflowing and the park from descending into chaos!

What Do You See on the Screen?

You view an angled, retro theme park from above (just like classic RollerCoaster Tycoon). You see colorful paths, trees, and visitors ("Peeps") entering the park gates. Stations stand around the park with long queue lines. At the bottom of your screen is a simple track-building toolbar.

How the Game Works (Step-by-Step)

1

Step 1: Lay Down Your Coaster Track

Click on a station platform and drag track pieces on the isometric grid: build flat sections, chain-lift hills going up, steep drops plunging down, sharp curves, and complete the circuit back to the station.

2

Step 2: Physics Launch Your Coaster Train

A coaster train spawns automatically. It clicks slowly up the lift hill, then gravity takes over! It zooms down drops at thrilling speeds, swoops around banked turns, and pulls into the station to load waiting passengers.

3

Step 3: Move Swarms of Theme Park Guests ("Peeps")

Guests constantly enter your park with different desires. Thrill-seekers look for tall drops and loops, while casual guests look for gentle scenic rides. They line up in the station queues waiting for your coaster.

4

Step 4: The Triage Panic (The "Mini Metro" Twist!)

If a station queue gets full (16+ guests waiting), a circular warning clock starts ticking down! You have to act fast: add more cars to your train, raise dispatch speed, or lay a second coaster line before guests riot!

Gameplay Flow, Fun Factor & Win Conditions

A clear explanation of coaster physics risk, weekly upgrades, and victory rules

Why It Is Immensely Fun to Play

1. The Joy of Kinetic Momentum: Watching your tiny coaster train zoom down steep hills and bank around corners is instantly satisfying.
2. Addictive Time Management: It gives you the fun coaster-building creativity of RollerCoaster Tycoon with the fast-paced, high-stakes panic of Mini Metro.
3. Zero Slow Downtime: There is no boring financial waiting; you are constantly expanding and optimizing your park lines in real time.

The Physics Risk: Don't Derail the Train!

Unlike trains in regular transit games, roller coasters obey gravity! If you build a giant drop and immediately go into a flat, sharp turn with no brakes, the coaster train enters too fast and can violently derail into a cloud of confetti! You have to design rides that are fast and exciting, but physically safe.

The Weekly Upgrade Choice (Every 90 Seconds)

Every 90 seconds of gameplay, the game pauses and rewards your progress with a choice of 1 out of 3 upgrades:

A

Track Expansion Package

+1 New Coaster Station and Line Color (allows you to connect a completely new area of your park) OR +15 Extra Track Pieces.

B

Train Capacity Upgrade

+2 Extra Carriages per train (doubles the number of guests loaded per dispatch, instantly solving station backlog bottlenecks).

C

Special Coaster Engineering

+1 Inversion Loop Piece (skyrockets thrill excitement rating) OR +1 Block Brake System (allows 2 trains to safely run on 1 track).

How You Win & How You Lose

- How You Win: Keep the park flowing and successfully deliver 500 guests to complete Level 1, unlocking new park maps with water rivers, hills, and islands.
- How You Lose: If station queues overflow and stay full for 30 seconds, the Park Rating drops to zero and the park is closed down—Game Over!
